

Species of Vascular Plants Reported from Bay County, Florida

Whitetop Pitcher Plant (*Sarracenia leucophylla*)

Apalachicola Aster (*Aster spinulosus*)

Harper's Beauty (*Harperocallis flava*)

Pine Lily (*Lilium catesbaei*)

By: Lisa A. Keppner and Edwin J. Keppner

Co-chairs, Biodiversity Subcommittee

June 2006

Preface to 5th Revision

The fifth revision of this list of vascular plants from Bay County, Florida is a result of the addition of specimens to the existing local collections that contain specimens of vascular plants from Bay County and the St. Andrew Bay ecosystem. Supplies to add additional specimens to the BEST collection that were provided by the U.S. Fish and Wildlife Service, Panama City Field Office, are exhausted. As a result, additions to the BEST Herbarium in the future will be sporadic.

The table of species has been revised to include the specimens added to the BEST Herbarium by the authors and those specimens of species from Bay County that are located in other local herbaria that are not in the BEST Herbarium. Specimens that may have been added to the BEST Herbarium by people other than the authors are not included unless we were made aware of the additions to the herbarium. The number of species listed in the Atlas of Florida Vascular Plants for which no specimens exist in Bay County collections has been significantly reduced, and the knowledge of the vascular plants of Bay County better corresponds to the knowledge of the vascular plants of surrounding counties. Copies of this report can be obtained from the BEST offices at 850/215-5590, the BEST website (www.baybest.org), or contact the writers at 850/769-6247.

Lisa and Edwin Keppner

June 2006

Acknowledgments

The original work on the BEST Herbarium collection was performed by the writers during 1998 and was accomplished through a grant provided by the Norcross Wildlife Foundation, Inc. of Wales Massachusetts to the writers through BEST, Inc. The authors thank Dr. Loran Anderson of Florida State University for introducing us to the excitement of vascular plants and all of the time that he has spent educating and guiding us in the identification of specimens and allowing us access to the FSU herbarium.

The authors also express their sincere appreciation to the Northwest Florida Water Management District; Florida Department of Environmental Protection, Division of Recreation and Parks District 1; the Junior Museum of Bay County; Tyndall Air Force Base; and to the St. Joe Company for permission to collect specimens on their respective properties. We also thank the individual property owners who gave us permission to collect on their land; Ms. Fenn (Fenn's pasture), Mr. Ron Houser (Econfina Estates Drive), Mrs. V. Brown (Elders Lane), Mr. & Mrs. Steve McLellan (Jessica Court), and Dr. & Mrs. Neal Dunn (Bunkers Cove Road). We also express our appreciation to the U.S. Fish and Wildlife Service, Panama City Field Office for their support, encouragement, and for providing supplies for the continuation of the work beyond 1999.

The St. Andrew Bay Environmental Study Team, Inc. (BEST, Inc.)

The St. Andrew Bay Environmental Study Team, Inc. (BEST, Inc.) is a not-for profit 501(c)(3) Florida Corporation consisting of citizens concerned with the wise management of the natural resources of the St. Andrew Bay ecosystem. BEST, Inc. is dedicated to charitable, scientific, and educational purposes in support of its mission to evaluate the status of the St. Andrew Bay ecosystem and its watershed to identify any problems, and to initiate and implement corrective action. To that end, BEST, Inc. seeks and administers funds in support of projects that provide information regarding the natural resources of the ecosystem, and serves as the financial arm of the St. Andrew Bay Environmental Study Team (BEST) proper.

The St. Andrew Bay Environmental Study Team (BEST)

BEST has met since 1988 to share information regarding the natural resources of the St. Andrew Bay ecosystem and to address expressed concerns for the ecological integrity of the ecosystem. The mission of BEST is to evaluate the status of the St. Andrew Bay ecosystem, identify problems, and initiate corrective actions where necessary. The goal of BEST is to maintain and restore, where necessary, a healthy St. Andrew Bay ecosystem for the benefit of all people. The mission of BEST is achieved through the work of the subcommittees of BEST. The subcommittees and representatives of various community groups comprise the Steering Committee of BEST. The information obtained is provided to local, state, and federal decision-makers, natural resource managers, and the public.

Appendix I. A List of the Species of Vascular Plants known from Bay County, Florida	

Purpose

The purpose of the work described herein is to provide an inventory and reference collection of the species of vascular plants known from Bay County, Florida and to make them available to natural resource managers, decision-makers, and any interested persons. To that end, the specimens of vascular plants collected in Bay County, Florida that are located in the local Bay County plant collections have been combined into a list that represents the species diversity of vascular plants in Bay County.

History of the List of Vascular Plants of Bay County, Florida

In July 1998, the first ecosystem management plan for the St. Andrew Bay ecosystem was printed by the Florida Department of Environmental Protection. This was a joint effort of the BEST Steering Committee with Ed Keppner serving as the project manager to draft the plan for review and approval of the Steering Committee. A part of the plan was an assessment of the species diversity of the ecosystem, and it was at that time that Keppner realized that Bay County was lagging behind the surrounding counties in the number of species of vascular plants reported for our county and ecosystem. As Chairpersons of the Natural Resources Subcommittee at the time, Keppner prepared a grant proposal to the Norcross Foundation through BEST, Inc. for funds to initiate a survey of the vascular plants of Bay County and prepare herbarium specimens of all species collected during the year of the grant. The result was the development of the BEST Herbarium that is housed at the Panama City Field Office of the U.S. Fish and Wildlife Service. The Service purchased herbarium cabinets and provided funds for supplies for the work to continue. The work has been proceeding since its inception in 1998.

Other herbarium collections exist locally that contain specimens of vascular plants from Bay County that are not in the BEST Herbarium. The authors provided preliminary herbarium collections for St. Andrews State Park and Camp Helen State Park as volunteers for the Friends of St. Andrews State Park, Inc. The authors also provided a preliminary herbarium collection and compiled a list of the vascular plants reported from the Econfina Creek Water Management Area for the Northwest Florida Water Management District (NFWWMD) as volunteers for the District. The NFWWMD herbarium includes specimens from the Bay and Washington County portions of the St. Andrew Bay ecosystem. Lastly, Dr. Horace Loftin prepared a collection of specimens of vascular plants from the local Navy Base. That collection is now housed at the Panama City Field Office of the U.S. Fish and Wildlife Service.

Introduction

Bay County has been and is, along with the rest of Florida, experiencing a period of rapid development associated with a steadily increasing human population with an attendant loss, alteration, and fragmentation of natural habitats. Unfortunately, the flora and fauna of Bay County, with the exception of the St. Andrew Bay estuarine system, has not been studied and catalogued to the same extent as many other counties in Florida. Large areas of Bay County have not been surveyed. Therefore, the knowledge of the biological resources that are being subjected to the adverse impacts of development is restricted.

Stein et al. (2000) provided an analysis of the species diversity of the United States and identified six regions of the country that they considered “hotspots” of species diversity. The information used to identify the “hotspots” included the flora and fauna of the area, rare species, endemic species, and biotic communities. The central region of the Florida Panhandle was identified as one of the six “hotspots”. The area is centered over the Apalachicola River system but extends westward to include Bay County on the periphery. It is hoped that this inventory provides additional information regarding the species diversity of vascular plants in the area of study.

Keppner (1996) prepared an inventory of the biological resources of the St. Andrew Bay estuary based on a search of the literature. This inventory revealed that the fauna of the estuary was quite diverse, but the flora of the estuary and the ecosystem of which it is a part was not well documented with the exception of the list of vascular plants provided by Wunderlin et al. (1996-2005). Keppner & Keppner (1997) prepared a preliminary list of the vascular plants known from Bay County based on the species reported in the literature and specimens contained in the herbarium collections then present in Bay County. Keppner and Keppner (2001) provided a revision of the existing ecosystem management plan for the St. Andrew Bay ecosystem and provided a general list of the protected or tracked flora and fauna of the St. Andrew Bay ecosystem, and Keppner and Keppner (2005) provided information on the protected and tracked species in Bay County and our ecosystem. Therefore, we see no reason to repeat that information here and refer those interested in the protected species of vascular plants and those species of vascular plants tracked by the Florida Natural Areas Inventory to that document.

Observations made during continuing field work indicate that the diversity of vascular plants in Bay County is greater than that provided in Appendix I. Additional species not previously reported from Bay County or species listed for Bay County but not yet present in collections in the county are encountered on almost every field trip. It is hoped that the present collection and database will encourage others to add to the collection and the database until a thorough survey of the vascular plants of Bay County is completed. The BEST Herbarium also requires additional specimens of those species already represented to demonstrate the variation that occurs within each species and to understand their habitat and distribution countywide.

Structure of the Report

The work consists of two parts; (a) the herbarium collection that contains specimens of the species collected and preserved to date, and (b) the database of species known from Bay County. The collection of specimens from Bay County was restricted to land on which permission to collect was obtained or from road right-of ways. The BEST Herbarium collection contains over 1308 mounted and consecutively numbered specimens arranged by family and then by genus and species. Until 2005, each specimen was placed in a mylar sheath to provide additional protection. The mylar sheath can be removed and then resealed should the specimen need to be dissected. The mylar sheaths were discontinued in 2004 due to the absence of a supplier resulting in the specimens added since then being uncovered and more easily damaged.

Taxonomy is a dynamic science and taxa are continuously being erected or synonymized. This can present a problem in choosing which taxonomic scheme to follow. The specimens in the

collection are labeled in accordance with the taxonomic designations in Clewell (1985) and, to some degree, Wunderlin (1998). Wunderlin and Hansen (2003) provided a revision of the 1998 book that contains many taxonomic changes in the entire taxonomic hierarchy. These changes were not carried over to database for the BEST Herbarium and are not reflected in this document. This arbitrary decision was based on our understanding that most of the people who would use the collection are familiar with the use of the keys in Clewell (1985) and the works of Godfrey and Wooten (1979), Godfrey and Wooten (1981), and Godfrey (1988) which provided detailed keys and descriptions of species. The common names are from Wunderlin (1998) because this work provides common names for the vast majority of the plants included on the list whereas Clewell (1985) does not. The BEST herbarium collection is housed at the U.S. Fish and Wildlife Service, Panama City Field Office and is available for use by any interested person or group.

The database of the species included herein from Bay County is based on the following: the list of specimens collected and prepared from 1998-2005 and deposited in the BEST Herbarium, the specimens in the herbaria of the St. Andrews State Park, Camp Helen State Park, Northwest Florida Water Management District herbarium, specimens in the authors' collection, and the records in Wunderlin et al. (1996-2005). Examination of the specimens contained in the collections other than the Bay County collection can be obtained by contacting the authors or the agency responsible for the collection. The St. Andrews State Park and Camp Helen State Park collections are kept at the Florida Department of Environmental Protection, Division of Recreation and Parks, District 1 office in St. Andrews State Park, Bay County, Florida. The Northwest Florida Water Management District collection is housed in the District's Marianna, Florida office.

In May 2006, the authors donated over 200 specimens of vascular plants in their collection from Bay County to the Florida State University Herbarium. These specimens were considered new records for Bay County and were added to those specimens deposited by the authors over the past eight years. The donation of these specimens meets the criteria for listing of species from the county in the Florida Atlas of Vascular Plants.

Wunderlin et al. (1996 - 2005) was used as a basis for the determination of the number of species of vascular plants then known from Bay County, Florida. The species listed in Wunderlin et al. (1996 - 2005) for Bay County are based upon the presence of a specimen of that species in a recognized herbarium such as those at various universities in Florida and elsewhere. Anecdotal reports were not included. The advantage of basing the list on the presence of reference specimens is obvious. The disadvantage is that many common species are not collected and placed in herbaria. As a result, the lists in Wunderlin (1996-2005) do not include many common species in Bay County such as Cabbage Palm and others. A few specimens of species reported from Bay County for which we have not collected a specimen in Bay County are included in the BEST Herbarium and the list below for reference purposes. These specimens were collected in adjacent counties. They provide a specimen for examination and comparison should the species be collected in Bay County at some time in the future.

The database is arranged alphabetically by family then genus and species (Appendix I). Listings without a specimen number, location, collection date etc. are species on the list contained in Wunderlin et al. (1996 - 2005) that do not have a specimen in a Bay County collection to date.

Those specimens from counties other than Bay are species that have been reported from Bay County, but were collected in adjacent counties as stated above. Specimen numbers beginning with a: “**B**” are located in the BEST Herbarium, “**S**” are located in the St. Andrews State Park Herbarium, “**C**” are in the Camp Helen State Park Herbarium, “**W**” are in the NFWFMD collection, and “**K**” are in the authors= collection. The location column, except where indicated, is the place in Bay County where the specimen was collected. Specific locations in terms of latitude and longitude can be obtained from the writers. The date is the date the specimen was collected. Habitat is the general type of habitat in which the specimen was collected. Abbreviations used in the habitat column are: **HW** = Hardwood, **DPFW** = Disturbed pine flatwood, **DWPFW** = Disturbed wet pine flatwood, **FW** = Fresh water, **ROW** = Right of Way, **WPFW** = Wet pine flatwood, **FP** = Flood plain, **PFW** = Mesic pine flatwood, and **High Pine** = High Pine. The “**Nat**” column indicates native (**n**) versus non-native (**nn**) as reported in Wunderlin (1998).

Results and Discussion

In 1996, Wunderlin et al. (1996-2005) listed 4,012 species of vascular plants from the State of Florida and 856 species subspecies, and varieties from Bay County. Wunderlin and Hanson (2003) raised the total number of species of vascular plants in Florida to 4,145 of which 228 are endemic to Florida and 1,318 are non-native species.

The Bay County herbarium, as of June 30, 2006, contained about 1,308 specimens. The list of the total number of species of vascular plants from Bay County reported here contains about 1331 species in about 543 genera in 151 families. This is a 55% increase in the number of species reported from the county in 1996 and brings the number of species known from Bay County in line with the more intensively studied counties in the Panhandle. The list contains about 150 non-native species that represent about 11% of the flora of Bay County. The 79 species of vascular plants that are protected and/or tracked by FNAI represent about 6% of the total number of species known from Bay County (Keppner and Keppner, 2005).

Unusual Species

The specimen of *Tritonia x crocosmiiflora* and the specimen of *Rheo* sp. in the collection are examples of non-native, ornamental plants that may become established in natural settings temporarily or permanently. These plants were collected distant from human habitation and were growing quite vigorously in a wet ditch and a disturbed area contiguous with a natural mesic hardwood forest respectively.
